

Special session title: Security Optimization in wireless sensor networks

Abstract:

Using wireless sensor networks is increasing today in modern applications and internet of things. Among these applications are some, which are delay sensitive, in such applications detected informations, can become useless if the end to end delay exceed a given threshold. Security of sensor networks is also an important factor especially with the appearance of new network attacks. In this session, we will study the security issues in sensor networks and the different kinds of possible attacks.
